

GENERAL INFORMATION

Different Types of Pliers:

Combination Pliers: Combination pliers are multi-purpose pliers, combining gripping jaws with wire cutters. They are ideal for gripping, compressing, bending, twisting, extracting and cutting various materials.

Fencing Pliers: These pliers are used for cutting different gauges of wire and for driving in and removing staples.

Flat Nose Pliers: The flat tapered jaws of these pliers are ideal for twisting wires and metal. The jaws are also slightly elongated making them ideal for mechanical and electrical work.

Long Nose Pliers: The jaws of this type of pliers are elongated and pointed at the tip. Long nose pliers are very versatile and can be used for a wide variety of applications such as electrical work, jewelry making, bending and twisting wire, and fishing.

Vicegrip: Also known as locking pliers, these pliers have a wide range of applications and uses. The jaws of a vicegrip can be locked around objects such as bolts, nuts, pipes, and other parts for a strong firm grip. Vicegrips are especially useful for those stubborn bolts and nuts that are difficult to turn due to rust, corrosion, or excessive tightening.

Waterpump Plier: Also known as channel locks, tongue and groove pliers. The lower jaw can be locked into several different positions depending on the size needed. These pliers are used for turning large nuts and bolts, and for working with pipes, and other plumbing applications.

Carpenter's Pincer: Concrete nippers and pliers can be used to either cut or pull nails and staples from pieces of wood. High-leverage ones are best suited to cutting nails as the increased leverage gives them much better performance.

Concrete Nipper: They can be used to cut tiles to size. When using them for this task you should only remove small pieces of tile at a time, otherwise you risk cracking the whole tile.

handy tool tip

Plier Construction and Parts

Nose or jaws: working end of pliers and the part that varies most from type to type.

Fulcrum or pivot point: The fulcrum or pivot point is the center of the pliers where the jaws and handles connect. The pivot point is what allows you to apply enough force for the jaws to perform their function.

Cutters: This sharpened section of the pliers is located at the base of the jaws near the fulcrum of the pliers. Cutters are used for cutting wire and cables and other materials.

Handles: This is the part you hold. Coated with a material for better gripping.
